

• A taste of Python

- Introductions and practical course information
- Elements of a computers and computer programs
- An introduction to our course computing environment
- A taste of Python

Geo-Python A taste of Python

Lecturer: David Whipp david.whipp@helsinki.fi

4.9.2019

HELSINGIN YLIOPISTO HELSINGFORS UNIVERSITET UNIVERSITY OF HELSINKI

Who are we?

• Lecturers

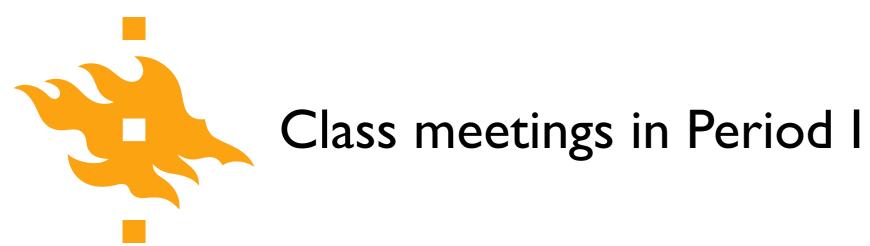

- Vuokko Heikinheimo AutoGIS
- Dave Whipp Geo-Python + IntroQG
- Assistants
 - Lotta Ylä-Mella Geo-Python + IntroQG
 - Sakari Sarjakoski AutoGIS
 - Sara Todorovic AutoGIS

• Geo-Python (Period I) <u>https://geo-python.github.io</u>

• AutoGIS (Period II) <u>https://autogis.github.io</u>

 IntroQG (Period II) <u>https://introqg.github.io</u>

- Lectures
 - Wednesdays 9-12, CK112, Exactum
- Work sessions
 - Thursdays 12-16, A113-114, Physicum
 - Fridays 10-14 OR 8-12 (see Weboodi), A113-114, Physicum

• You can feel free to come to either work session (or both)

Automating GIS processes

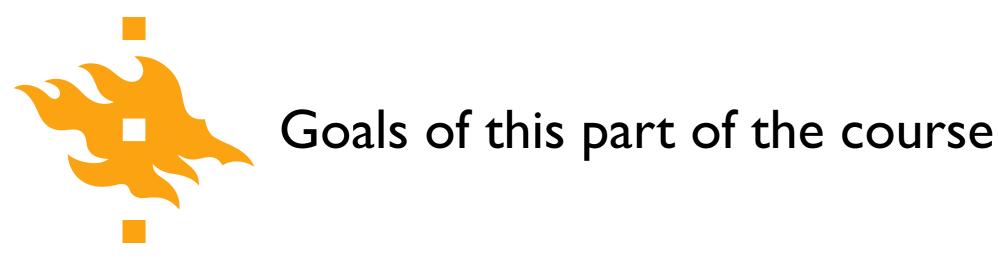

- **Period I**: basics of programming, data analysis and visualization (Geo-Python)
- **Period 2**: spatial data management, analysis and visualization (AutoGIS)
- Course code **GEOG-329**
- **IO ECTS** in total

AutoGIS materials are mainly developed by grandmaster Henrikki Tenkanen who is currently in the UK

 We'd like to know a bit about who you are, and ask that you direct your web browser or phone to a real-time poll at <u>https://geo-python.github.io/poll</u>

There are basically three goals in this part of the course

- I. Introduce the **Python programming language**
- 2. Develop basic programming skills
- 3. Discuss essential (good) programming practices needed by young scientists

• Provide an overview of **basic computing practices**, and why you should learn them

• Define **computers** and **programming languages**, and how they operate

• Look at the components of a **computer program** and a strategy for writing your own code

Learning to program

- A significant part of this course will be development of basic **programming skills** that will help you write and use simple numerical models
 - I know you're not computer scientists I'm not either
 - Our goal is take small steps to learn together
 - Do you really need to know how to program? Yes.
 - You might not be a superstar, but learning to write simple codes can be very useful

Why learn to program?

 Geology and geography are becoming increasingly quantitative and basic programming skills are one of the fundamental quantitative skills that will help you be a better scientist

Why learn to program?

in **[11]**:

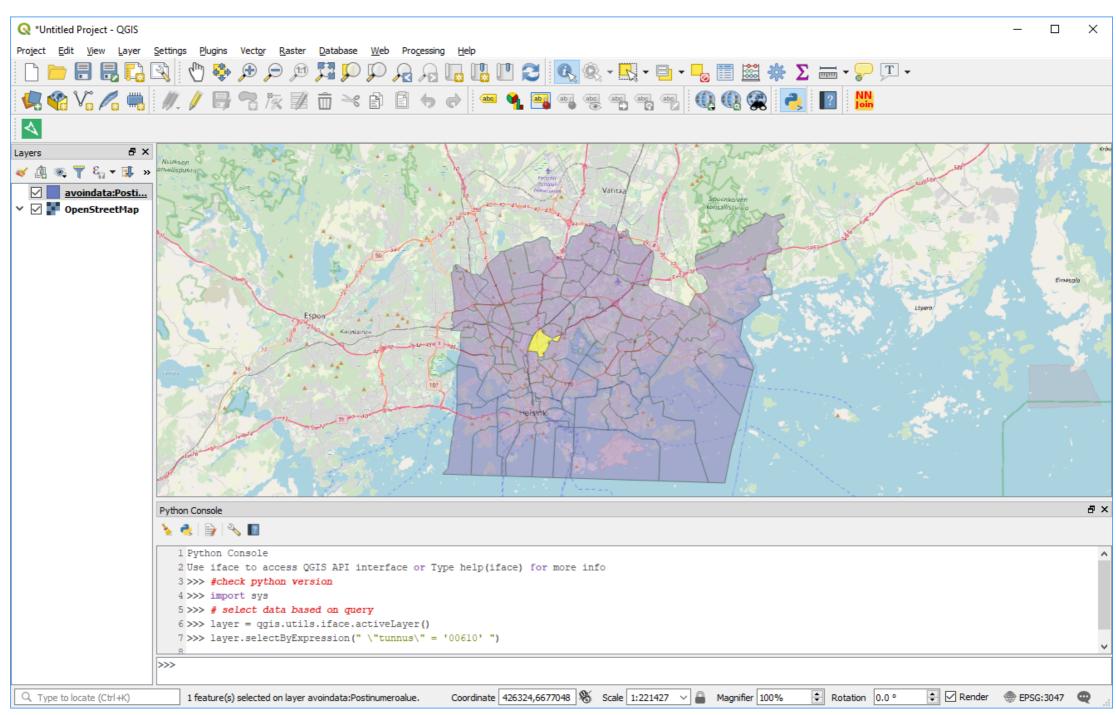

IPython: Users/whipp

- in [7]: average_geoscientist = 100
 - [8]: programming_factor = 1000
 - [9]: quantitative_geoscientist = average_geoscientist * programming_factor
 - [10]: quantitative_geoscientist > average_geoscientist
 [10]: True

- You can extend existing software by developing your own solutions when solutions do not exist or are inefficient
 - Many software packages offer the ability to extend their capabilities by adding your own short programs (e.g., ArcGIS, ParaView, Google Earth, etc.)

You can interact with GIS software using Python

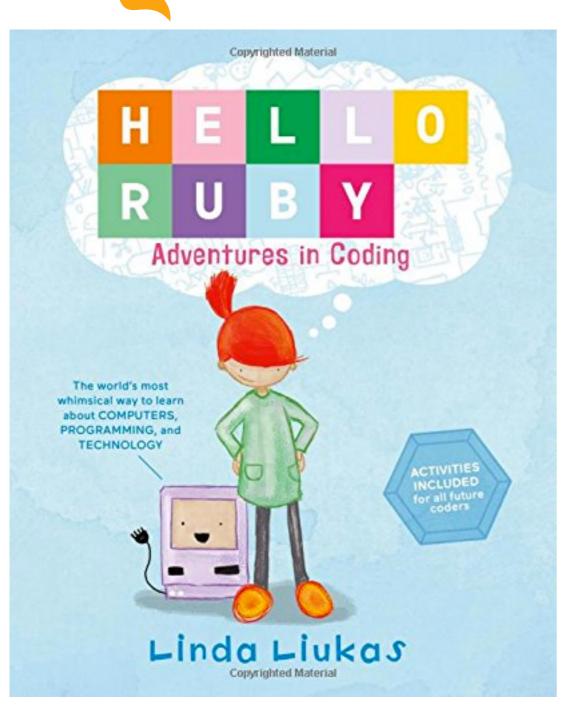

HELSINGIN YLIOPISTO HELSINGFORS UNIVERSITET UNIVERSITY OF HELSINKI

Python for geo-people

Python console in QGIS

Why learn to program?

- Believe it or not, programming is fun! It involves
 - Breaking complex problems down into simpler pieces
 - Developing a strategy for solving the problem
 - Testing your solution

 All of this can be exciting and rewarding (when the code works...)

The scientific method...

...and how programming can make you a better scientist

- I. Define a question
- 2. Gather information and resources (observe)
- 3. Form an explanatory hypothesis
- 4. Test the hypothesis by performing an experiment and collecting data in a reproducible manner
- 5. Analyze the data
- 6. Interpret the data and draw conclusions that serve as a starting point for new hypothesis
- 7. Publish results
- 8. Retest (frequently done by other scientists)

Learning to program can help us...

- I. Define a question
- 2. Gather information and resources (observe)
- 3. Form an explanatory hypothesis
- 4. Test the hypothesis by performing an experiment and collecting data in a reproducible manner
- 5. Analyze the data
- 6. Interpret the data and draw conclusions that serve as a starting point for new hypothesis
- 7. Publish results
- 8. Retest (frequently done by other scientists)

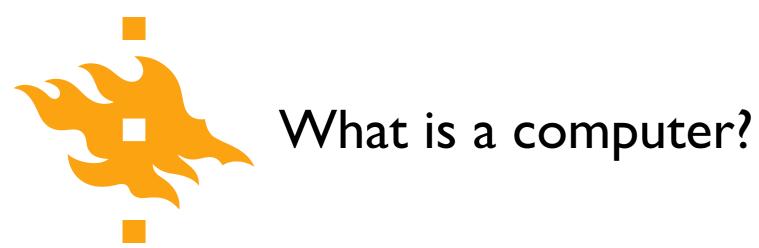

Good programming practices can help us...

- I. Define a question
- 2. Gather information and resources (observe)
- 3. Form an explanatory hypothesis
- 4. Test the hypothesis by performing an experiment and collecting data in a reproducible manner
- 5. Analyze the data
- 6. Interpret the data and draw conclusions that serve as a starting point for new hypothesis
- 7. Publish results

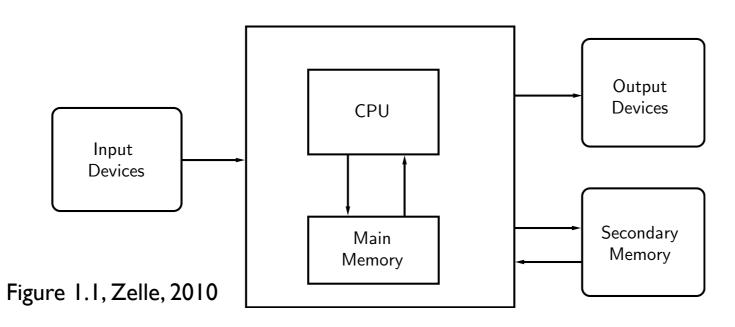

8. Retest (frequently done by other scientists)

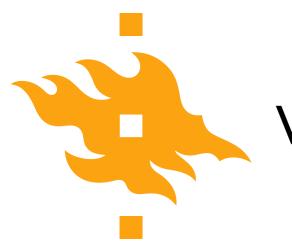

- Let's crowdsource: <u>https://geo-python.github.io/poll</u>
 - Add your thoughts on what comprises a computer
 - Vote for options you support

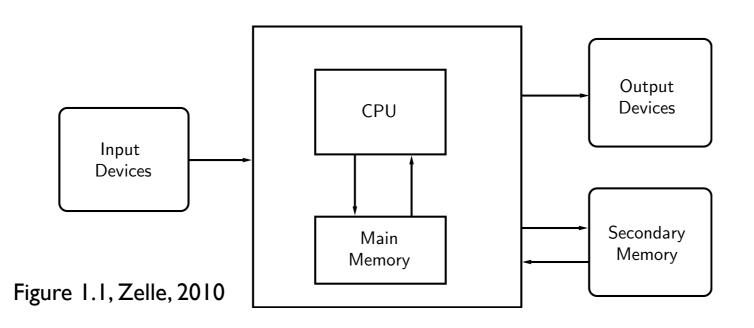

• A computer is a machine that stores and manipulates information under the control of a changeable program

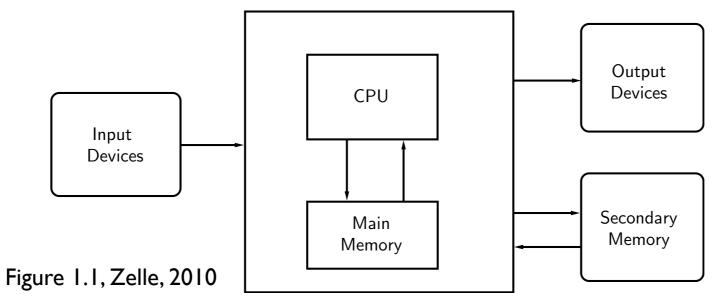

- A computer is a machine that stores and manipulates information under the control of a changeable program
 - Information can be input, modified into a new/useful form and output for our interpretation

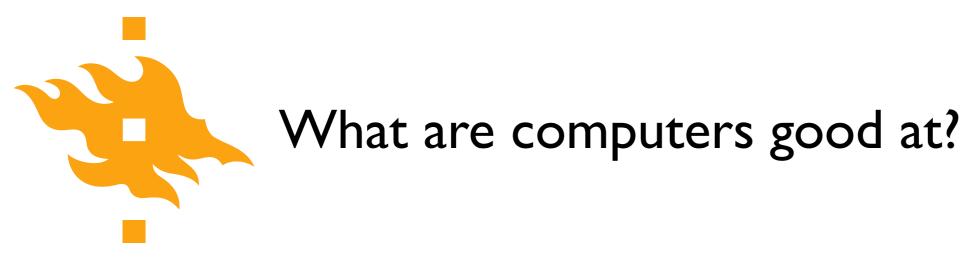

- A **computer** is a machine that stores and manipulates information under the control of a **changeable program**
 - Controlled by a computer program that can be modified

>>> print("2 + 2 =", 2 + 2)

- Well-defined, clear tasks
 - Add 2 + 2 and return the answer

• Data storage/manipulation

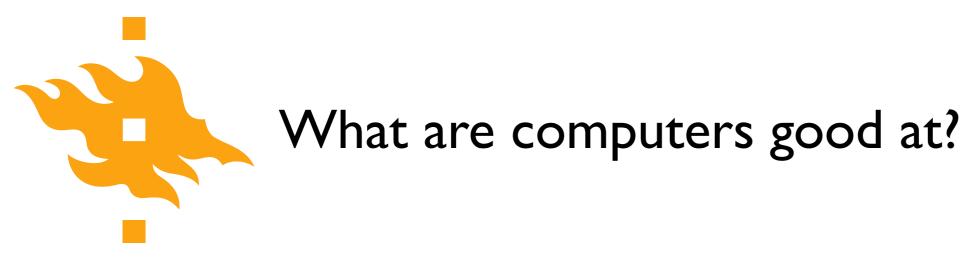

• Repetitive calculations

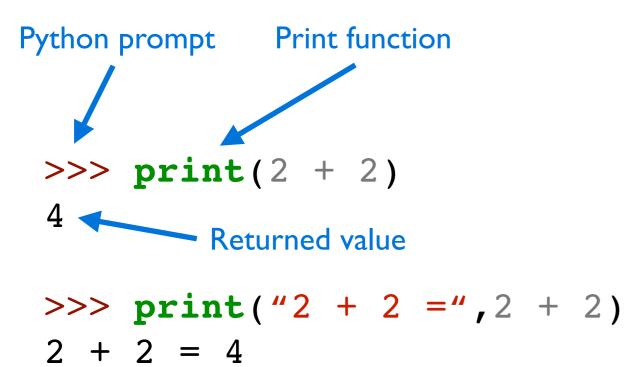

• Processing data or instructions

2 + 2 = 4

>>> print(2 + 2)

4

- Well-defined, clear tasks
 - Add 2 + 2 and return the answer

• Data storage/manipulation

• Repetitive calculations

• Processing data or instructions

- Abstract or poorly defined tasks
 - Calculate pi

HELSINGIN YLIOPISTO HELSINGFORS UNIVERSITET UNIVERSITY OF HELSINKI

Python source code

Python for geo-people

 A program is a detailed list of step-by-step instructions telling the computer exactly what to do

• The program can be changed to alter what the computer will do when the code is executed

• **Software** is another name for a program

What is a programming language?

- A computer language is what we use to 'talk' to a computer
 - Unfortunately, computers don't yet understand our native languages
- A programming language is like a code of instructions for the computer to follow
 - It is exact and unambiguous
 - Every structure has a precise form (syntax) and a precise meaning (semantics)
- Python is just one of many programming languages

Developing a program

- Coming up with a specific list of instructions for the computer to follow in order to accomplish a desired task is <u>not easy</u>
- The following list will serve us as a general software development strategy
 - I. Analyze the problem
 - 2. Determine specifications
 - 3. Create a design
 - 4. Implement the design
 - 5. Test/debug the program
 - 6. Maintain the program (if necessary)

Let's consider an example

- As an American, I was raised in a country that uses Fahrenheit for temperatures
 - 70°F is lovely
 - 90°F is hot
 - Water freezes at 32°F

• The problem here in Finland is that I don't always know what I should wear to work when I find weather reports with temperatures in degrees Celsius

• I think a simple program could help

I. Analyze the problem

• Before you can solve a problem, you must figure out exactly what should be solved

I. Analyze the problem

- Before you can solve a problem, you must figure out exactly what should be solved
- 2. Determine specifications
 - Describe exactly what the program will do
 - Don't worry about how it will work. Determine the input and output values and how they should interact in the program

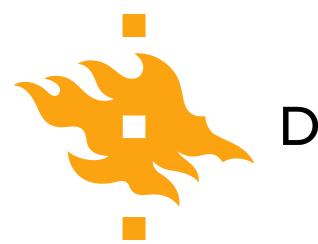

3. Create a design

- What is the overall structure of the program? How will it work?
- It is often helpful to write out the code operation in pseudocode, precise English (or Finnish) describing the program. Be specific!

3. Create a design

- What is the overall structure of the program? How will it work?
- It is often helpful to write out the code operation in pseudocode, precise English (or Finnish) describing the program. Be specific!
- 4. Implement the design
 - If you've done a good job with the previous steps, this should be fairly straightforward. Take your pseudocode and 'translate' it into Python

5. Test/debug the program

- Now you can put your new Python code to the test (literally) by running it to see whether it reproduces the expected values
 - For any test, you should know the correct values in advance of running your code. How else can you confirm it works???

5. Test/debug the program

- Now you can put your new Python code to the test (literally) by running it to see whether it reproduces the expected values
 - For any test, you should know the correct values in advance of running your code. How else can you confirm it works???
- 6. Maintain the program
 - If you've written something that will be shared by other users, a helpful programmer will continue to add features that are requested by the users

• What is a computer?

• What is a program?

• What are some of the steps in developing a program?

• What is a computer?

• What is a program?

• What are some of the steps in developing a program?

• What is a computer?

• What is a program?

• What are some of the steps in developing a program?

Zelle, J. M. (2010). Python programming: an introduction to computer science (2nd ed.). Franklin, Beedle & Associates, Inc.

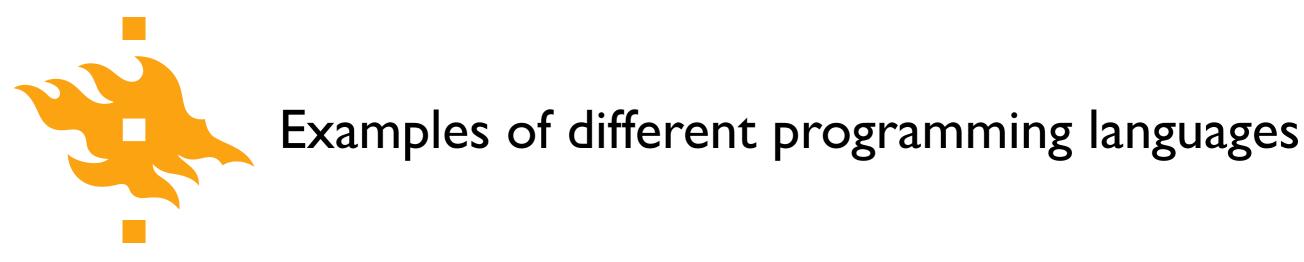

Our first taste of Python

Open a web browser and navigate to <u>https://geo-python.github.io/site/lessons/L1/overview.html</u>

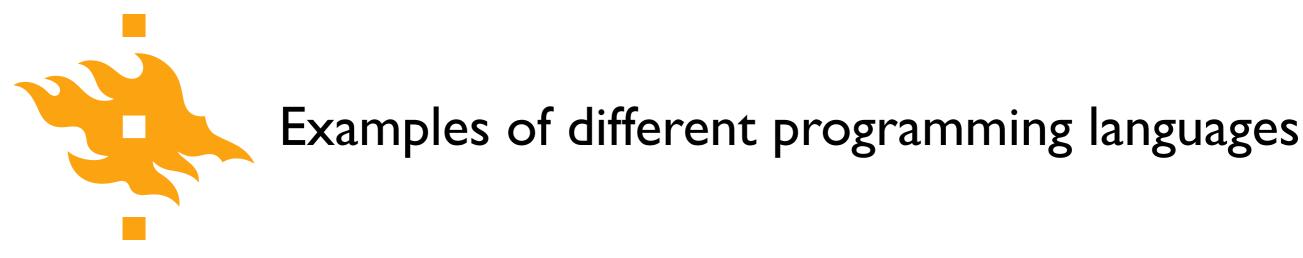

Puupyton / Green tree python

Python for geo-people

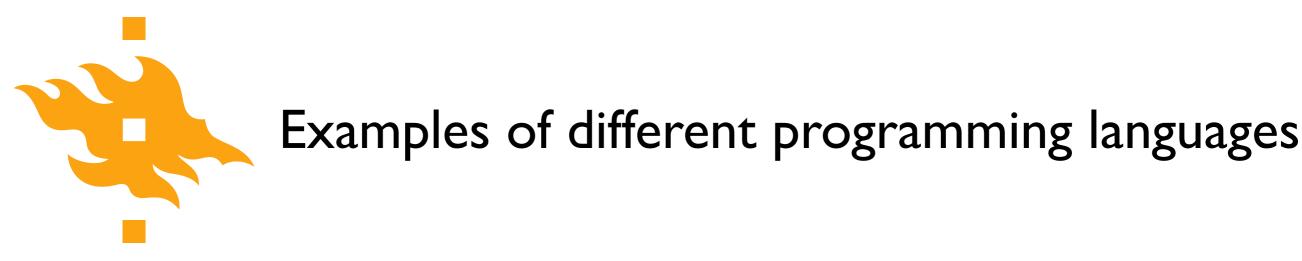

print("Hello, world!")

print("Hello, world!")

• What will happen when the computer executes this expression?

n

print("Hello, world!")

- What will happen when the computer executes this expression?
 - "Hello, world!" will be written to the screen

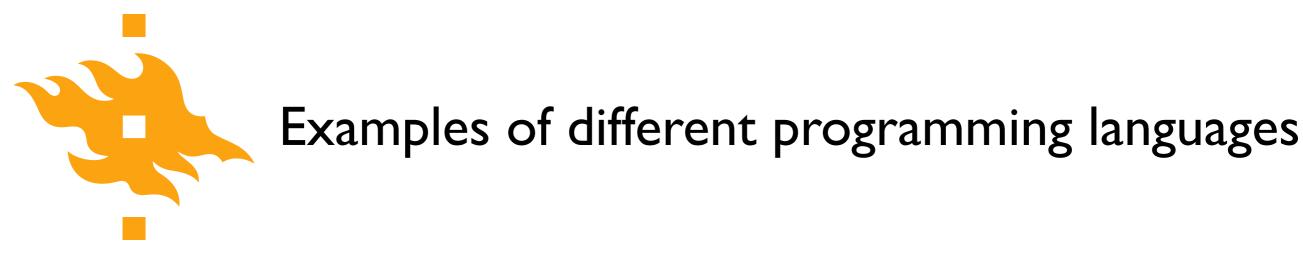

n

print("Hello, world!")

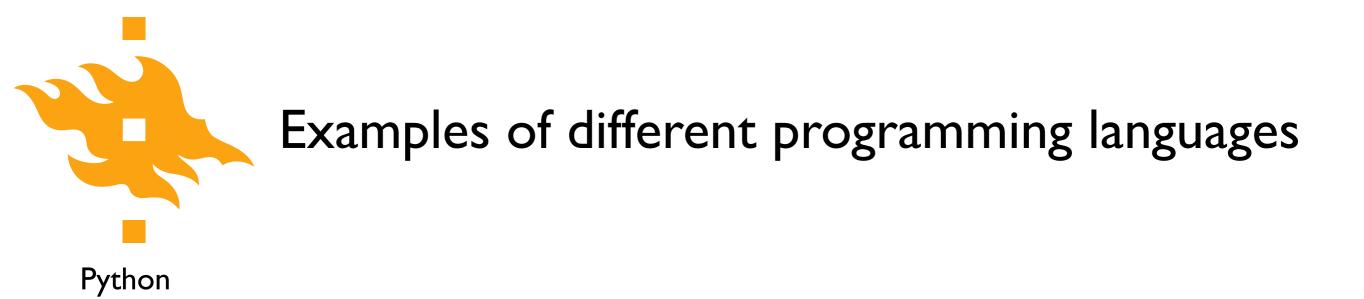

- What will happen when the computer executes this expression?
 - "Hello, world!" will be written to the screen

- Here, the syntax is the "print" function
- The meaning (semantics) is to write values to the screen

pring("Hello, world!")

• What will happen when the computer executes this expression?

• What will happen when the computer executes this expression?

Examples of different programming languages

Python

MATLAB

print("Hello, world!")

disp('Hello, world!')

Examples of different programming languages

Python

```
print("Hello, world!")
```

Fortran 90

```
program hello
    write(*,*) 'Hello, world!'
end program hello
```

MATLAB

disp('Hello, world!')

С

```
#include <stdio.h>
int main(void)
{
    printf("Hello, world!\n");
    return 0;
}
```

Examples of different programming languages

Python

```
print("Hello, world!")
```

Fortran 90

```
program hello
    write(*,*) 'Hello, world!'
end program hello
```

MATLAB

disp('Hello, world!')

С

```
#include <stdio.h>
int main(void)
{
    printf("Hello, world!\n");
    return 0;
}
```

These are all examples of high-level programming languages, languages meant to be understood by humans. Computer hardware actually understands a very low-level language known as machine language.
