

Class overview today - September 2, 2020

- **A taste of Python**
 - Introductions and practical course information
 - Elements of a computers and computer programs
 - An introduction to our course computing environment
 - A taste of Python

Geo-Python

A taste of Python

Lecturer: David Whipp
david.whipp@helsinki.fi

2.9.2020

Who are we?

- **Lecturers**
 - Vuokko Heikinheimo - AutoGIS
 - Dave Whipp - Geo-Python
- **Assistants**
 - Sonja Koivisto - AutoGIS
 - Emil Ehnström - Auto GIS
 - Aleksi Rantanen - Geo-Python

Course websites

- Geo-Python (Period I)
<https://geo-python.github.io>
- AutoGIS (Period II)
<https://autogis.github.io>

Class meetings in Period I

- Lectures
 - **Wednesdays 9:15-12:00**
- Work sessions
 - **Thursdays 12:15-16:00**
 - **Fridays 10:15-14:00**
- You can feel free to come to either work session (or both)

“AUTOGIS”

PERIOD 1:

- **GEOG-329-1, Automating GIS-processes 1, Geo-Python**
- Introduction to programming, data analysis and visualization

PERIOD 2:

- **GEOG-329-2, Automating GIS-processes 2, Geography**
- Spatial data management, analysis and visualization

5 + 5 ECTS

Who are you?

- We'd like to know a bit about who you are, and ask that you direct your web browser or phone to a real-time poll at <https://geo-python.github.io/poll>

Goals of this part of the course

There are basically three goals in this part of the course

1. Introduce the **Python programming language**
2. Develop **basic programming skills**
3. Discuss **essential (good) programming practices** needed by young scientists

Some motivation

Goals of this lecture

- Provide an overview of **basic computing practices**, and why you should learn them
- Define **computers** and **programming languages**, and how they operate
- Look at the components of a **computer program** and a strategy for writing your own code

Learning to program

- A significant part of this course will be development of basic **programming skills** that will help you write and use simple numerical models
- I know you're not computer scientists - I'm not either
 - Our goal is take small steps to learn together
- Do you really need to know how to program? **Yes.**
- You might not be a superstar, but learning to write simple codes can be very useful

Why learn to program?

- Geology and geography are becoming increasingly quantitative and basic programming skills are one of the fundamental quantitative skills that will help you be a better scientist

Why learn to program?

```
IPython: Users/whipp

In [7]: average_geoscientist = 100

In [8]: programming_factor = 1000

In [9]: quantitative_geoscientist = average_geoscientist * programming_factor

In [10]: quantitative_geoscientist > average_geoscientist
Out[10]: True

In [11]: █
```

- You can extend existing software by developing your own solutions when solutions do not exist or are inefficient
- Many software packages offer the ability to extend their capabilities by adding your own short programs (e.g., ArcGIS, ParaView, Google Earth, etc.)

You can interact with GIS software using Python

The screenshot displays the QGIS desktop application. The main window shows a map of the Helsinki region with a purple-shaded area representing a specific district. The interface includes a menu bar, a toolbar, and a Layers panel on the left. The Python Console window is open at the bottom, showing the following code:

```
1 Python Console
2 Use iface to access QGIS API interface or Type help(iface) for more info
3 >>> #check python version
4 >>> import sys
5 >>> # select data based on query
6 >>> layer = qgis.utils.iface.activeLayer()
7 >>> layer.selectByExpression(" \"tunnus\" = '00610' ")
8
>>>
```

The status bar at the bottom indicates that 1 feature(s) is selected on the layer 'avoindata:Postinumeroalue'. The coordinate is 426324,6677048, the scale is 1:221427, and the projection is EPSG:3047.

Why learn to program?

- Believe it or not, **programming is fun!** It involves
 - Breaking complex problems down into simpler pieces
 - Developing a strategy for solving the problem
 - Testing your solution
- All of this can be exciting and rewarding (when the code works...)

The scientific method...

...and how programming can make you a better scientist

1. Define a question
2. Gather information and resources (observe)
3. Form an explanatory hypothesis
4. Test the hypothesis by performing an experiment and collecting data in a reproducible manner
5. Analyze the data
6. Interpret the data and draw conclusions that serve as a starting point for new hypothesis
7. Publish results
8. Retest (frequently done by other scientists)

Learning to program can help us...

1. Define a question
2. **Gather information and resources (observe)**
3. Form an explanatory hypothesis
4. **Test the hypothesis by performing an experiment and collecting data in a reproducible manner**
5. **Analyze the data**
6. **Interpret the data and draw conclusions that serve as a starting point for new hypothesis**
7. Publish results
8. Retest (frequently done by other scientists)

Good programming practices can help us...

1. Define a question
2. Gather information and resources (observe)
3. Form an explanatory hypothesis
4. **Test the hypothesis by performing an experiment and collecting data in a reproducible manner**
5. Analyze the data
6. Interpret the data and draw conclusions that serve as a starting point for new hypothesis
7. Publish results
8. **Retest (frequently done by other scientists)**

What is a computer?

What is a computer?

- Let's crowdsource: <https://geo-python.github.io/poll>
- Add your thoughts on what comprises a computer
- Vote for options you support

What is a computer?

Figure 1.1, Zelle, 2010

- A **computer** is a machine that stores and manipulates information under the control of a changeable program

What is a computer?

Figure 1.1, Zelle, 2010

- A **computer** is a machine that stores and **manipulates information** under the control of a **changeable program**
- Information can be input, modified into a new/useful form and output for our interpretation

What is a computer?

Figure 1.1, Zelle, 2010

- A **computer** is a machine that stores and **manipulates information** under the control of a **changeable program**
- Controlled by a computer program that can be modified

What are computers good at?

```
>>> print(2 + 2)
```

```
4
```

```
>>> print("2 + 2 =", 2 + 2)
```

```
2 + 2 = 4
```

- Well-defined, clear tasks
 - Add $2 + 2$ and return the answer
- Data storage/manipulation
- Repetitive calculations
- Processing data or instructions

What are computers good at?

Python prompt

Print function

```
>>> print(2 + 2)
```

```
4
```

Returned value

```
>>> print("2 + 2 =", 2 + 2)
```

```
2 + 2 = 4
```

- Well-defined, clear tasks
 - Add 2 + 2 and return the answer
- Data storage/manipulation
- Repetitive calculations
- Processing data or instructions

What aren't computers good at?

- Abstract or poorly defined tasks
- Calculate pi

What aren't computers good at?

```

The first 1000 digits of pi

- Abstract or poorly defined tasks
- Calculate pi

What aren't computers good at?

www.csc.fi

- Some problems simply cannot be solved, or require too much computing power

What aren't computers good at?

Sisu was decommissioned 19.8.2019

www.csc.fi

- Some problems simply cannot be solved, or require too much computing power

What is a program?

```
# Define plot variables
misfit = NA_data[:,0]
var1 = NA_data[:,1]
var2 = NA_data[:,2]
var3 = NA_data[:,3]
clrmin = round(min(misfit),3)
clrmax = round(min(misfit),2)
trans = 0.75
ptsize = 40
```

Python source code

What is a program?

Fortran punchcard

```
# Define plot variables
misfit = NA_data[:,0]
var1 = NA_data[:,1]
var2 = NA_data[:,2]
var3 = NA_data[:,3]
clrmin = round(min(misfit),3)
clrmax = round(min(misfit),2)
trans = 0.75
ptsize = 40
```

Python source code

- A **program** is a detailed list of step-by-step instructions telling the computer exactly what to do
- The program can be changed to alter what the computer will do when the code is executed
- **Software** is another name for a program

What is a programming language?

- A **computer language** is what we use to ‘talk’ to a computer
- Unfortunately, computers don’t *yet* understand our native languages
- A **programming language** is like a code of instructions for the computer to follow
 - It is exact and unambiguous
 - Every structure has a precise form (**syntax**) and a precise meaning (**semantics**)
- Python is just one of many programming languages

Developing a program

- Coming up with a specific list of instructions for the computer to follow in order to accomplish a desired task is not easy
- The following list will serve us as a **general software development strategy**
 1. Analyze the problem
 2. Determine specifications
 3. Create a design
 4. Implement the design
 5. Test/debug the program
 6. Maintain the program (if necessary)

Let's consider an example

- As an American, I was raised in a country that uses Fahrenheit for temperatures
 - 70°F is lovely
 - 90°F is hot
 - Water freezes at 32°F
- The problem here in Finland is that I don't always know what I should wear to work when I find weather reports with temperatures in degrees Celsius
- **I think a simple program could help**

Developing a program

I. Analyze the problem

- Before you can solve a problem, you must figure out exactly what should be solved

Developing a program

1. Analyze the problem

- Before you can solve a problem, you must figure out exactly what should be solved

2. Determine specifications

- Describe exactly what the program will do
- Don't worry about how it will work. Determine the input and output values and how they should interact in the program

Developing a program

3. Create a design

- What is the overall structure of the program? How will it work?
- It is often helpful to write out the code operation in **pseudocode**, precise English (or Finnish) describing the program. Be specific!

Developing a program

3. Create a design

- What is the overall structure of the program? How will it work?
- It is often helpful to write out the code operation in **pseudocode**, precise English (or Finnish) describing the program. Be specific!

4. Implement the design

- If you've done a good job with the previous steps, this should be fairly straightforward. Take your pseudocode and 'translate' it into Python

Developing a program

5. Test/debug the program

- Now you can put your new Python code to the test (literally) by running it to see whether it reproduces the expected values
- For any test, you should know the correct values in advance of running your code. How else can you confirm it works???

Developing a program

5. Test/debug the program

- Now you can put your new Python code to the test (literally) by running it to see whether it reproduces the expected values
- For any test, you should know the correct values in advance of running your code. How else can you confirm it works???

6. Maintain the program

- If you've written something that will be shared by other users, a helpful programmer will continue to add features that are requested by the users

Recap

- **What is a computer?**
- What is a program?
- What are some of the steps in developing a program?

Recap

```

These are all examples of **high-level programming languages**, languages meant to be understood by humans. Computer hardware actually understands a very low-level language known as machine language.
